improvement in
flow of urine

10/10
men maintain
continence

10/10
men retain
erections

9/10
men sustain
ejaculation

An exciting new option for treatment

Men with benign prostatic hyperplasia (BPH) can be overwhelmed by their choices for treatment. They may be worried about the side effects and symptoms caused by surgery or medications.

Potential Concerns

- **83%** of men with BPH do not wish to sacrifice sexual function for symptom relief with surgery
- **3 in 4** men with BPH feel that surgery requires a tradeoff between symptom relief and side effects
- **1 in 2** men did not realize how important maintaining sexual function was to them before surgery

We're excited to be the first practice in the Newnan and Fayette areas to offer an alternative: an advanced, minimally invasive option that uses imaging and robotic technology to control a heat-free waterjet that removes the problematic prostate tissue.

What are the advantages of this procedure?

- No incision is necessary, as we access the prostate through the urethra.
- Having two kinds of imaging in the operating room allows our surgeons to see the entire prostate.
- With the precision afforded by the imaging and the robotic technology, men treated with this surgery experience a very low rate of irreversible complications, such as incontinence, ejaculatory dysfunction, and erectile dysfunction.
- This course of treatment has been proven to offer years of relief from BPH symptoms.
